Main workflow

Cheat sheet for R-*package* ecpc:
Empirical bayes Co-data learnt Prediction and Covariate selection

- Install and load package:
```
install.packages("ecpc")
library("ecpc")
```

- Prepare data and co-data (see right):

- Estimate parameters:
```
fit <- ecpc(Y, X, Z=list(Z_1, Z_2))
```

- Visualise estimates:
>Regression coefficients:
```
plot(fit, show="coefficients")
```
>Prior variances:
```
plot(fit, show="priorweights")
```

- Predict for new samples X_2:
```
predictions <- predict(fit, X_2)
```

- Select variables:
>A posteriori:
```
fit_post <- postSelect(fit, X, Y)
```
>Transform ridge to elastic net penalties
 with parameter alpha:
```
fit_squeezy <- squeezy(Y, X, alpha=alpha,
               lambdas=fit$penalties)
```

Preparing co-data

In group sets

- Create group set:
 >Categorical:
```
gs_1 <- createGroupset(factor)
```
 >Continuous discretised in non-overlapping groups:
```
gs_2 <- createGroupset(values)
```
 >Continuous discretised in overlapping groups
 for adaptive discretisation:
```
gs_3 <- splitMedian(values)
```
 >Group set on the group level for hierarchical groups
 for adaptive discretisation:
```
gs_grouplvl <- obtainHierarchy(groupset_3)
```

**- Choose hypershrinkage (penalty on the
  group level):**
 >Few groups:
```
hypershrinkage = "none"
```
 >Many groups:
```
hypershrinkage="ridge"
```
 >Select groups:
```
hypershrinkage="lasso"
```
 >Groups structured in (hierarchical) groups:
```
hypershrinkage="hierLasso,ridge",
groupsets.grplvl=list(groupset_grouplvl)
```

- Estimate parameters:
```
fit_gs <- ecpc(Y, X,
          groupsets=list(gs_1, gs_2, gs_3),
          groupsets.grplvl=list(NULL, NULL,
                           gs_grouplvl),
          hypershrinkage=c("none", "ridge",
                          "hierLasso,ridge"))
```

In co-data matrices

$$Z^{(d)} = \begin{bmatrix} 1 & 1 & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} & 1 & 1 & 1 \end{bmatrix}^T$$

- Create co-data (related) matrix:
 >For group set (make dummy variables):
```
Z_1 <- createZforGroupset(gs_1)
```
 >Spline matrix for continuous co-data:
```
Z_2 <- createZforSplines(values)
```
 >Difference penalty matrix for splines:
```
S_1 <- createS(G=dim(Z_2)[2])
```
 >Constraints for splines:
```
Con_1 <- createCon(G=dim(Z_2)[2]), shape)
```
 for shape one of "positive", "monotone.i"
 (increasing), "monotone.d" (decreasing), "convex",
 "concave", or any combination thereof by
 separating with a "+", e.g. "positive+convex"

**- Choose hypershrinkage (penalty on the co-data
  variables):**
 >No penalty/constraints, e.g. linear co-data model:
```
paraPen=NULL, paraCon=NULL
```
 >Generalised ridge penalty, e.g. generalised additive
  co-data model:
```
paraPen=list(Z2=list(S1=S_1))
```
 >Constraints, e.g. shape constrained additive
  co-data model:
```
paraCon=list(Z2=Con_1)
```

- Estimate parameters:
```
fit_Z <- ecpc(Y, X, Z=list(Z_1, Z_2),
         paraPen=list(Z2=list(S1=S_1)),
         paraCon=list(Z2=Con_1))
```
